Subscribe to the Dr.Web Anti-virus service and get a discount...

...for the number of objects you are protecting:

from 10% to 40%—depending on the total number of objects you place under Dr.Web's protection—the workstations, servers or mobile devices covered under your subscription,

...and for continually using the service:

from 5% to 15%—an additional discount for those who maintain a continuous subscription.

! Discounts are cumulative and valid only when the service is used through one supplier. When the supplier is changed, any discounts held become invalid and then discounts begin to accrue again with the new supplier.

About Doctor Web

Doctor Web is the Russian developer of Dr.Web anti-virus software. Dr.Web anti-virus software has been developed since 1992. The company is a key player on the Russian market for software that meets the fundamental need of any business — information security. Doctor Web is one of the few anti-virus vendors in the world to have its own technologies to detect and cure malware.

Doctor Web was the first company on the Russian market to offer an anti-virus as a service and, to this day, is still the undisputed Russian market leader in Internet security services for ISPs.

For already 10 years Doctor Web's partners have been supplying subscriptions to the Dr.Web Anti-virus service on the Russian and international markets.

A managed Dr.Web Anti-virus cloud service that provides any number of devices with anti-virus protection on a monthly subscription basis

Solves information security issues.
Affordably. Instantly.

The anti-virus that meets the challenge

Every company inevitably encounters information security threats and is forced to protect its computers with anti-viruses. No company can run its business without computers, and not every company can have personnel dedicated to maintaining its PCs (let alone enforce security policies!) due to the high cost and scarcity of such specialists. And, at the same time, hacker attacks are targeting the SMB sector—it is namely this sector that is currently the most vulnerable. And, it is precisely for this sector that hacker attacks are the most painful and devastating.

The Dr.Web Anti-virus service will help your company provide its computer systems with anti-virus protection and enforce your security policies—at minimum cost and only to the extent you need in the here and now.

With the help of the Dr.Web Anti-virus service, your company will get:

- uninterrupted anti-virus protection;
- employee device security policies that are strictly adhered to;
- the ability to pay only for those components currently being used;
- the ability to instantly add or remove subscriptions due to changes in employee numbers.

A managed anti-virus

After subscribing to the service, you will get access to the Subscription Control Center (SCC). Use it to manage licenses, access the Dr.Web software and statistics showing how the software is operating in the systems it is protecting, contact the service supplier and Doctor Web's technical support service at any time, day or night, and even manage Dr.Web's protection settings!

Controlled protection

If you want Dr.Web to maintain full control over the anti-virus protection system of your company's local network, deploy the Dr.Web anti-virus protection's Control Center which is provided free of charge. The Control Center can provide you with reports and statistics—at any time and from anywhere in the world—showing how your Dr.Web anti-virus software is working.

If your company lacks sufficiently qualified information security specialists, a professional service supplier can manage your company's anti-virus protection. The service supplier will:

- remotely and centrally manage the protection of your computer systems;
- develop individual information security policies;
- join your protected computers into groups and develop security policies that align with your business needs;
- configure the anti-virus agents in compliance with the developed policy;
- assign/cancel jobs on customer workstations;
- control customer access to the anti-virus settings or even completely prohibit users from modifying the anti-virus settings;
- monitor virus incidents and, as a result of the monitoring, promptly respond to detected incidents;
- train staff on issues related to anti-virus security and security policies;

Those are just a few of the services your supplier can provide!

Only the protection that's needed

- Dr.Web supports a wide range of OSs which allows customers to obtain high-quality, enterprise-class protection for their PCs, Macs, servers, and mobile devices on a monthly lease basis.
- Subscriptions are offered in the form of subscription packages. Customers can select their needed level of anti-virus protection and subscription length, taking into consideration their security requirements and current financial situation.
- Managing a service subscription is easy. Whenever necessary, subscribers can go into their personal subscriber area to activate a subscription, suspend a subscription (for the duration of a vacation or business trip), expand their Dr.Web protection to include new PCs/Macs and mobile devices or decrease their number of subscriptions, and renew services. They can also switch packages and get information about how Dr.Web works.
- If a customer is a company that has a full- or part-time system administrator, the service supplier can transfer to that individual the duties related to managing the anti-virus protection system through the Control Center. This will give the company an even greater ability to control its information security.

The Dr.Web Anti-virus service allows your company to use only those options it really needs.
